

## PubMed on Tap Overview

PubMed on Tap is a **research** project of the Communications Engineering Branch of the Lister Hill National Center for Biomedical Communications, National Library of Medicine. PubMed on Tap is an application targeted at mobile health care professionals. The goal of the project is to discover and implement design principles that facilitate focused retrieval of MEDLINE® citations from a PDA through a *wireless* connection to the Internet.

The search tab.

Initial search results.

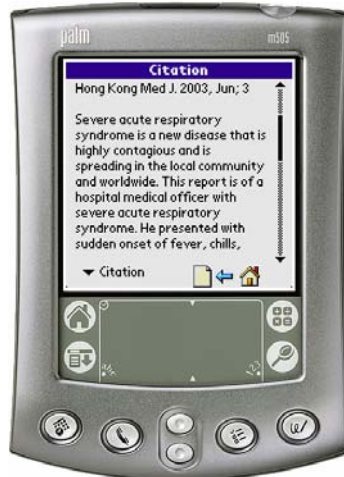

More Information for an article with MeSH terms.

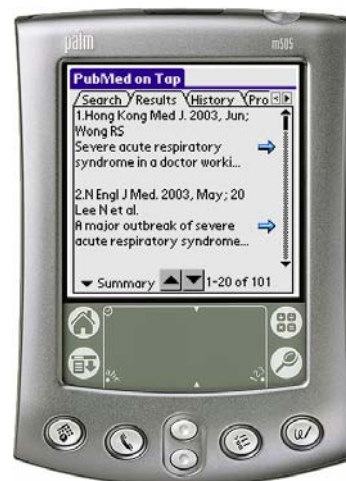

PubMed on Tap does not use a browser. The initial version of the client program runs only on Palm OS devices. This version includes selected PubMed features, including several search limits and the Popular Related articles, plus a feature unique to PubMed on Tap: My Journals. Before designing our next versions, we are seeking feedback from volunteer evaluators. If you or your colleagues have Palm PDAs and access to a wireless LAN, please consider evaluating PubMed on Tap for us.
